

# 804Mesh Set-Up Quick Start Guide

## Installing and configuring the 804Mesh is as simple as 1, 2, 3 ...

1

Connect the 804Mesh satellite unit to a power source. Wait approximately 60 seconds until the three lights on top light up green.

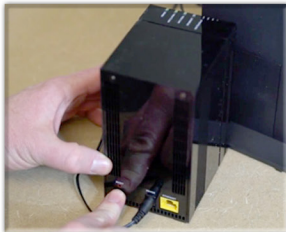

2

Press the button labeled, WPS, found on the bottom of the GigaCenter router. Hold for five seconds. When button is released, will blink Amber/Orange.

3

Then, within two minutes, press the button labeled, WPS, on the back of the 804Mesh satellite unit.

**See other side for instructions on finding ideal placement of your 804Mesh satellite**

# 804Mesh Satellite Location Assist

To assist with the ideal location of the 804Mesh satellite, **a series of four indicator lights, labeled Wi-Fi Backhaul** can be found along the top of the unit.

**Three green neon lights and one red light** then the 804Mesh is **too close** to the GigaCenter router. Move the 804Mesh unit further away.

If just **one light is green**, then the 804Mesh is **too far** from the GigaCenter and a new location should be found.

If **two lights are green**, then the distance between the 804Mesh and the GigaCenter will produce **adequate** results.

If **three or four of the lights are green with no red light**, then the distance between the 804Mesh and the GigaCenter will produce **optimal** results.

**Installing multiple wireless access points in the home will improve in-home Wi-Fi coverage even more, and result in optimal performance.**
